Prepared for Aurora Health Group · 31 July 2026

Executive summary

Aurora Health Group operates AI across clinical triage and scheduling with capable teams and clear executive sponsorship. The constraint is governance: systems are in production without a maintained inventory, documented human oversight, or an owner named against each deployment. Under the EU AI Act these are obligations that fall on the deployer, and evidence is what a regulator asks for first.

Generated deterministically from your responses; the AI narrative layer was not used.

Where you stand

The composite score places Aurora Health Group in the Follower band. The scale below is fixed across every E-ARI assessment, which is what makes the position comparable over time and between organisations.

Pillar profile — the shape of readiness across all eight dimensions.

Pillar results

Strategy & Vision		64	Chaser	weight 15%
Data & Infrastructure		25	Laggard	weight 15%
Technology & Tools		53	Chaser	weight 12%
Talent & Skills		75	Chaser	weight 13%
Governance & Ethics		25	Laggard	weight 15%
Culture & Change Management		75	Chaser	weight 10%
Process & Operations		50	Follower	weight 10%
Security & Compliance		50	Follower	weight 10%

2 interdependency adjustments applied. Cross-pillar rules are part of the published methodology: a weak foundation discounts what it cannot support.

- Governance below 30 — Technology capped at 70% to reflect the unmanaged-risk discount (75 > 52.5).
- Data below 30 — Strategy reduced 15% because the data foundation cannot deliver on the stated ambition (75 > 63.75).

Pillar detail

For each pillar: the answer that scored highest and the answer that scored lowest. The weakest answers are where the leverage analysis looks first.

Strategy & Vision	64 · Chaser
Strongest - "How effectively does your organization measure and communicate the ROI of AI initiatives?" (4/5)	
Weakest - "Does your organization have a formally documented AI strategy aligned with business objectives?" (4/5)	

Data & Infrastructure	25 · Laggard
Strongest - "Does your infrastructure provide scalable compute and storage resources adequate for AI training and inference?" (2/5)	
Weakest - "How would you rate the overall quality, consistency, and completeness of your organizational data?" (2/5)	

Technology & Tools	53 · Chaser
Strongest - "Does your organization effectively leverage cloud, edge, or hybrid infrastructure for AI workloads?" (4/5)	
Weakest - "How mature is your organization's AI/ML platform and tooling ecosystem?" (4/5)	

Talent & Skills	75 · Chaser
Strongest - "Does your organization have defined AI career paths, role frameworks, and communities of practice?" (4/5)	
Weakest - "Does your organization have sufficient AI/ML technical talent to execute current and planned initiatives?" (4/5)	

Governance & Ethics

25 · Laggard

- Strongest - "How well does your organization comply with relevant AI regulations and industry standards?" (2/5)
Weakest - "Does your organization have a formal AI governance framework with clear accountability structures?" (2/5)

Culture & Change Management

75 · Chaser

- Strongest - "Does leadership communicate a clear and inspiring vision for how AI will benefit the organization and its people?" (4/5)
Weakest - "How strongly does your organizational culture support experimentation, learning from failure, and innovation?" (4/5)

Process & Operations

50 · Follower

- Strongest - "To what extent are operational teams equipped and empowered to manage AI systems day-to-day?" (3/5)
Weakest - "To what extent has your organization identified and prioritized processes suitable for AI automation?" (3/5)

Security & Compliance

50 · Follower

- Strongest - "How well prepared is your organization for AI-related regulatory requirements (e.g., EU AI Act, NIST AI RMF)?" (3/5)
Weakest - "How mature are your organization's AI-specific security controls (adversarial robustness, model protection)?" (3/5)

05 HIGHEST-LEVERAGE MOVES

Highest-leverage moves

Each move below was computed by re-running the complete 5.3 pipeline with that single answer improved one step. The gains are exact and reproducible - they account for pillar weights, sector weighting and interdependency releases. They are not estimates.

- 1

Governance & Ethics · 2/5 to 3/5

Does your organization have a formal AI governance framework with clear accountability structures?

Also releases a cross-pillar scoring penalty.

+3.20 pts
- 2

Governance & Ethics · 2/5 to 3/5

How mature are your organization's practices for detecting and mitigating AI bias and fairness issues?

Also releases a cross-pillar scoring penalty.

+3.20 pts
- 3

Governance & Ethics · 2/5 to 3/5

To what extent does your organization ensure AI transparency and explainability for stakeholders?

Also releases a cross-pillar scoring penalty.

+3.20 pts
- 4

Governance & Ethics · 2/5 to 3/5

Are there established processes for AI risk assessment, impact evaluation, and incident response?

Also releases a cross-pillar scoring penalty.

+3.20 pts
- 5

Governance & Ethics · 2/5 to 3/5

How well does your organization comply with relevant AI regulations and industry standards?

Also releases a cross-pillar scoring penalty.

+3.20 pts

Path to Chaser: 2.9 points to the next maturity band. The shortest simulated path crosses it in 1 one-step improvements.

06 STRUCTURAL FINDINGS

Structural findings

Detected from how responses combine across pillars, not from any single answer. Each finding carries its evidence, business impact, and a concrete next move.

P-01 - Shadow IT Risk

CRITICAL

Mature AI tooling is being deployed without a governance framework to contain it.

Business impact - AI systems shipped under this profile typically do not have a documented owner, a risk classification, or an audit trail. Under the EU AI Act, this is the single fastest path to a non-compliance finding once enforcement begins August 2026.

Recommended move - Inventory every model and data product currently in production this quarter. Assign each one a risk class (per Article 6) and a named owner before adding any new capability.

Evidence: technology_1 = 4/5, technology_2 = 4/5, governance_1 = 2/5, governance_5 = 2/5

P-02 - The Ambition Gap

HIGH

Stated AI ambition outruns the data and governance scaffolding required to deliver it.

Business impact - Organisations in this profile typically launch flagship AI initiatives that stall at the proof-of-concept stage because the data lineage and accountability structures cannot support production. The first board-level postmortem usually arrives in months 9–12.

Recommended move - Before approving the next AI use case, ratify a one-page data governance charter (lineage, ownership, quality SLA) and a one-page AI governance policy. Both fit on a single page each. Both unblock everything downstream.

Evidence: strategy_1 = 4/5, strategy_2 = 4/5, data_3 = 2/5, governance_1 = 2/5

P-06 - Bias Blindspot

HIGH

AI systems are reaching production without operational fairness or explainability controls.

Business impact - A single bias incident at this profile has a documented 3–7% drop in customer-trust metrics and triggers regulator attention disproportionate to the underlying model performance. Reputational repair takes 18–36 months once an incident is public.

Recommended move - Introduce a model card for every production system within 60 days. Each card carries: training data lineage, performance by demographic slice, known limitations, and a contact owner. This is the lowest-cost change that prevents the worst class of incident.

Evidence: technology_3 = 4/5, governance_2 = 2/5, governance_3 = 2/5

Certification status

Aurora Health Group qualifies for E-ARI Bronze certification.

Foundational certification. The organization has begun its AI readiness journey with essential elements emerging, but significant investment is needed to achieve competitive AI maturity.

Path to Silver

Requires an overall score of 60 and the per-pillar minimums below.

Data & Infrastructure	25 to 40
Governance & Ethics	25 to 40

Recommended next steps

1. Stand up the AI system inventory — owner, purpose, risk class, per system
2. Document the human-oversight arrangement already in place clinically
3. Trace data lineage for the triage model back to source

Methodology and scope

Scores are produced by the E-ARI deterministic engine (scoring 5.3, methodology 5.3). Forty Likert responses normalise to eight pillar scores; six documented cross-pillar interdependency rules apply; eight X-Ray detectors scan response combinations for structural patterns; sector weighting re-balances pillar contributions (the healthcare profile was applied here); and the leverage simulation re-runs the entire pipeline once per possible improvement to produce exact gains. Identical inputs always produce identical outputs, and every version is recorded on the assessment.

Sector weighting rationale: Patient safety and clinical governance dominate. Bias, transparency and risk controls are not optional. Data quality is foundational.

The full methodology is published at e-ari.com/handbook.

Scope and limitations: this report reflects self-reported responses at the assessment date and is provided for internal governance purposes. It is not legal advice, and obligations under the EU AI Act or any other regulation should be confirmed with qualified counsel.
